Welcome to the EU Certificate of Conformity Portal

From July 2026, electronic Certificates of Conformity (eCoCs) will become mandatory for the 2018/858 vehicle categories, marking a major step toward harmonization, efficiency, and digital transformation. Whether you're a manufacturer preparing for structured data delivery or a national authority overseeing vehicle registration, this portal provides the tools, guidance, and updates you need.

Also for the framework directives 167/2013 and 168/2013 the delivery of eCoC's will have to be transferred to the new IVI 2.0 version. This means that if eCoC's are already provided for these directives, they must also be submitted in the new version from 5th July 2026.

Here you'll find:

- ✓ Clear explanations of CoC regulations and obligations under EU Regulation 2018/858
- ✓ Technical documentation standards and digital formats
- ✓ Tools for generating and validating eCoCs
- ✓ Best practices for compliance and data exchange

DOCUMENTATION

Various supporting documents are published here. Previous versions are moved to an Archive folder.

- **eCoC Manual**
Includes information on how to use fields within the IVI message.
- **IVI 2.0 Example files**
Includes a number of example CoCs with both the pdf and the xml file.
- **IVI release documentation**
Includes the recent version of:
 - **InitialVehicleInformation.xsd**
This is the most recent version of the XSD that the eCoC messages must comply with.
 - **IVI 2.0 - ICM Checking Module**
This document describes the checks that are carried out upon receipt of an eCoC. If an eCoC does not meet one of these checks, the eCoC will not be processed and the manufacturer will receive an error message.
 - **IVI 2.0 - Messagebook Excel format**
This document provides a tab for each framework directive with an overview of all relevant fields per vehicle category. It clearly shows the link between the fields in the IVI message and the associated data (including numbering), as defined in the regulatory framework.

- IVI 2.0 - Overview transition From IVI 1.11To2.0
This document describes how to translate data from a 1.x message to version 2.0. Not all fields can be translated. Where possible, this is indicated. The document can therefore help compose a correct 2.0 message.
- IVI 2.0 Change Overview v1.0
This document contains the changes that have been discussed within the Ereg Topic Group XII and implemented in IVI version 2.0.

TOOLS

Various tools can be found here to support the eCoC process. For the time being, a tool is available to translate an eCoC 1.x into an eCoC 2.0.

Conversion tool

This tool is to assist you in setting up an IVI 2.0 eCoC file. A basic conversion is made that largely corresponds to IVI 2.0 requirements. The created file can be used as a first basis to set up the 2.0 version. A 100% correct conversion will not be possible under any circumstances.

Under construction

A tool to sign an eCoC xml and to send it to a National Accesspoint of choice is currently under construction.

XML VALIDATION

This menu option allows you to check the eCoC before sending it to a Member State to see if it complies with the latest version of the IVI Checking Module (ICM).

The ICM is already being used by various Member States to check the plausibility of the eCoCs. Several rules have been included to ensure consistency of the data. Under the "Documentation" menu, these rules are further described in the ICM document.

MANUAL INPUT ECOC

Furthermore, there is a possibility via the website to enter a CoC manually to generate an eCoC in this way. This option is available for the Framework Directive 2018/858 and 168/2013. These eCoCs can also be checked against the ICM here. Please see next chapters for description.

MANUAL INPUT TOOL

The manual input tool is available to assist manufacturers in setting up a eCoC xml file by manually entering the complete dataset. The tool has been set up for the vehicle categories M,N and O and the L-category vehicles.

SELECTION SCREEN

- Select “Manual input eCoC” from the menu

Upload CoC XML

Bestand kiezen

Geen bestand gekozen

This option allows you to enter CoC data manually for the vehicle categories M, N, O and L in compliance with the XML-based data structure as defined in the Initial Vehicle Information (IVI). It supports the most recent version of IVI XSD scheme. Files can validated and downloaded locally.

Please note:
No rights can be derived from the results of this validation. This tool is intended for informational and testing purposes only. It does not guarantee acceptance or correctness of the data by external systems or authorities.

This is a first beta version of the manual input tool that can be used as a tool to generate an xml eCoC version 2.0. As a result of testing, some adjustments might still be required. Requests and questions can be mailed on to: eCoc2Help@rdw.nl.

Select framework directive	Select... ▼
Type of approval	Select... ▼
Select main vehicle category	Select... ▼
IVI version number	1
Designated type approval country	Select... ▼
Intended country of registration	Select... ▼
Stage of completion	Select... ▼

Next

This is the first screen where data has to be entered which is needed for setting up the next input screens, such as Type of approval or Stage of completion. Other fields are needed for handling the eCoC file such as IVI version number or Intended country of registration.

The next screens will be setup according to the selection you’ve made here. Some fields will show as mandatory before you can navigate to the next screen.

SELECT DATA WHICH HAS TO BE MULTIPLIED

Number of manufacturers	1
Number of mechanical couplings	0
Number of axles	2

Axle Groups +

Axle Group 1 ✕

☐ Axle 1

☐ Axle 2

Energy converters +

21. Engine code as marked on the engine ✕

Energy sources +

26. Fuel: Diesel/petrol/LPG/NG -
Biomethane/Ethanol/Biodiesel/Hydrogen ✕

Back Next

For some fields the number of occurrences must be entered. These are different per vehicle category. This is needed for setting up the next input screen. An example is that some fields on the CoC must be entered multiple times, e.g. for multiple axles, engines or fuels.

The fields shown here are specified per vehicle category:

- Number of manufacturers
For multistage vehicles where the previous stage information has to be entered, enter the number of manufacturers.
- Number of mechanical couplings
Enter the number of mechanical couplings which apply to the vehicle.
- Number of axles
Enter the number of axles which apply to the vehicle.
- AxleGroups
Enter the number of axle groups and axles belonging to that group which apply to the vehicle.
- Engine code as marked on the engine
Enter the engine code(s) which apply to the vehicle. If more than one engine code applies this has to be entered in order to show the engine information correctly on the next screens.
- Fuel
Enter the fuel(s) which apply to the vehicle per engine. If more than one fuel code applies this has to be entered in order to show the engine information correctly on the next screens.

Example:

Energy convertors 

21. Engine code as marked on the engine 

Energy sources 

26. Fuel: Diesel/petrol/LPG/NG - Biomethane/Ethanol/Biodiesel/Hydrogen 

21. Engine code as marked on the engine 

Energy sources 

26. Fuel: Diesel/petrol/LPG/NG - Biomethane/Ethanol/Biodiesel/Hydrogen 

This selection will result in duplicating several input fields for the CoC dataset:

▼ 27. Maximum power

Energy convertor - EngineCode 1

Energy source - Petrol

27.1. Maximum net power (internal combustion engine) (kW)

27.1. Maximum net power at (internal combustion engine) (min-1)

27.1. Maximum net power at (internal combustion engine) (min-1)

27.3. Maximum net power (electric motor) (kW)

27.4. Maximum 30 minutes power (electric motor) (kW)

Energy convertor - EngineCode2

Energy source - Electricity

27.1. Maximum net power (internal combustion engine) (kW)

27.1. Maximum net power at (internal combustion engine) (min-1)

27.1. Maximum net power at (internal combustion engine) (min-1)

27.3. Maximum net power (electric motor) (kW)

27.4. Maximum 30 minutes power (electric motor) (kW)

The data can then be entered accordingly. It's always possible to correct this selection by using the [Back] button.

ENTER THE ECOC DATA

The eCoC data can then be entered on the next screen. The setup of the screen is in accordance with the latest known regulations regarding the relevant fields and the order of the fields.

▼ General

Full name of the signer of the specified authority

Position (job description) of the signer of the CoC

0.1. Make (Trade name of the manufacturer) 

Make 

0.2. Type

Variant

Version

0.2.1. Commercial name(s): 

Name 

- Fields can be entered here in accordance with the IVI messagestructure
- Fields can be multiplied using the [+] button or remove using the [BIN] button
- If ranges are applicable it's possible to switch to entering minimum/maximum values by using the [Range] button. By default this is set to [Fixed value].

CHECKING THE COC DATA

By using the button [Validate XSD and ICM] the CoC data you have entered can be checked against the XSD and IVI Checking Module (ICM) plausibility checks.

- ✓ **Please note:** during this data entry no digital signature will be checked by the ICM check, as the signature will not be available in this step. You will have to sign the eCoC in a different process using your own signing certificate. Therefore this check is skipped here in order to be able to perform the plausibility check on the dataset itself. However, the signature is mandatory. Therefore, after signing, always check the eCoC via the ICM option itself, which can also be accessed via the site.
Via the menu option: XML Validation.

The ICM checks are described in the document: IVI 2.0 - ICM Checking Module. The document is available via the menu item "Documentation".

Error messages will be shown as follows:

ICM validation results Version: 2.0.0.969-beta ×		
Element	Rule	Message
VehicleIdentificationNumber	R010	Value must not contain I, O or Q.
NumberOfWheels	R117a	Mandatory.
NumberOfSeatingPositionsIncludingDriver	R124a	Mandatory.

If no errors are detected for the XSD or ICM check the following screen will appear:

- ✓ **Please note** that although many checks have been added to the ICM, it is still possible that incorrect data has been included in the eCoC, in all cases this remains the responsibility of the manufacturer.

GENERATE THE ECOC XML

This can be done during or after entering the data. De xml file can generated by using the [Generate IVI xml] button.

The file can then be stored on your system.

SIGNING THE ECOC XML

There's more information available on signing the eCoC in the eCoC Manual via the menuoption: "Documentation".

We're looking in to setting up an tooling for signing an eCoC file and sending it to a contact point. This is not yet available.
